Paddy Leaf Image

(Bacterial Leaf Blight)

Disease Detected:

Bacterial Leaf Blight (97.2%)

Visual Explanation (Grad-CAM)

Model Confidence:

97.2%

Natural Language Explanation

This image shows a paddy plant affected by Bacterial Leaf Blight, as indicated by the water-soaked lesions with wavy margins visible on the leaf surface.

The system is highly confident in this diagnosis (97.2% certainty).

Key visual indicators:

- Water-soaked lesions
- Wavy, irregular margins
- Yellowish-brown coloration

Uncertainty Level:

Low

Context-Aware Treatment Recommendations

Immediate Treatment

- Apply Streptomycin sulfate (500 ppm) as foliar spray
- Remove infected leaves
- Ensure proper drainage

Prevention Measures

- Use resistant varieties
- Maintain field sanitation
- Avoid excess nitrogen
- Monitor weather conditions

Long-term Management

- Crop rotation with non-hosts
- Balanced fertilization
- Regular field monitoring
- Maintain plant spacing
